in this paper we study how aggregate output responds to the arrival of a new general purpose  
technology gpt by looking at adjustment mechanisms that operate through labor markets we  
show that under a wide set of circumstances the arrival of a new gpt that raises long run  
output can trigger a recession in the short run furthermore we characterize features of the gpt  
that produce a cyclical adjustment path an initial recession occurs whenever a higher education  
level is required to operate the new gpt but a recession can also occur when the new gpt has  
lower educational requirements a cyclical adjustment path is more likely when inexperienced  
workers are less productive with the new technology and the faster productivity rises with  
experience in the new sector
